                                                                                                                                                                                                                                                                                                                                                                                                                                             3/j; double-stranded cDNA was ligated to Eco RI adaptors [AATTCGGATCCTTG], digested with Not I and cloned into the Not I and Eco RI sites of the modified pT73 vector. Library constructed by Bob Barstead. The C2C12 cell line (available from ATCC, catalog # CRL-1772) differentiates rapidly, forming contractile myotubes and producing characteristic mascle proteins.

indication or disease associated with aberrant, pathogenic or undestrable antibody production, particularly autoimmune or allergic diseases. The menthod comprises administering a T cell epitope peptide. The sequence of the epitope peptide comprises an immunodominant T cell epitope sequence of the antigen. The antigen comprises the immunodominant T cell epitope sequence. The method can be used to specifically tolerise or down regulate the priming or activity of antigen-specific T cells of a mammal. It can be used to prevent or inhibit an indication or disease associated with antibody production to an antigen specific T cells of a mammal. It can be used to prevent or inhibit an indication or disease associated with antibody production to an antigen such as an endogenous antigen, e.g. acetylcholine receptor, insulh, growth hormone, factor VIII or factor IX, or an exogenous antigen e.g. a fungal antigen, a plant antigen, an antigen of a domestic cat or an antigen of a mite. It can be used to treat autoimmune diseases, as most an antigen of a mite. It can be used to treat autoimmune diseases, as most antigen of a mite. It can be used to treat autoimmune diseases, as most antigen of a mite. It can be used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disease, autoimmune haemolytic anaemia, autoimmune thrombocytopaemia, autoimmune astimma, cryoglobulinaemia, thrombic thrombocytopaemia, primary biliary sclerosis, pernicious anaemia or pemphigus. It can be used for treating allergic diseases, e.g. allergic rhinitis, allergic astimma, atopic dermatitis, allergic gastroentheropathy, anaphylaxis, uricaria or angioedema. It can also be used in gene therapy for treating a disease such as haemophilia or diabetes or an indication such as adenosine deamidase deficiency, growth hormone deficiency, insulin sequence represents human acetylcholine receptor which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                  present invention describes a method for preventing or inhibiting an

                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising an isolated acetylcholine receptor (AChR) oligopeptide of about 12 to 20 amino acids. The peptides form a set of 69 overlapping antigenic peptide epitopes which show various affinities for human leukocyte antigens (HLA) HLA-DR2 and DR3. Also included is a composition comprising an antigenic peptide and a Major histocompatibility complex (MHC) component the binding site induces non-responsiveness in a target T cell in a mammal, where the MHC component is an MHC class II component. Peptides with affinity for HLA-DR2 and DR-3 from proteins other than AChR are also included. The composition is used to treat mysathenia gravis and other autoimmune diseases. The present sequence is the human acetylcholine receptor from which the 69 antigenic peptide epitopes are derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence represents a human acetylcholine receptor (hAChR) alpha-subunit variant which is used as all or part of a protein for alpha-subunit variant which is used as all or part of a protein for modulating the autoimmune response of an individual to hAChR. The protein can be administered to alleviate and/or treat myasthenia gravis (MG), and is useful for diagnosing the condition. It can be combined with a suitable carrier in pharmaceutical compositions, and is useful for such therapeutic (especially masal or oral) administration and diagnosis. MG is a human neuromuscular disorder, in which autoantibodies against AChR bind to the receptor and interfere with signal transmission comman of the AChR alpha-subunit appears to be the prime target for these autoantibodies, particularly the main immunogenic region (MIR). The protein enables antigen-specific immunotherapy which suppresses only adverse autoimmune responses whilst leaving owerall immune system intext, unlike current methods of treating MG using immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present sequence is not given in the specification but has been by the indexer as specified in the claim usin the sequences

The present sequence represents a human acetylcholine receptor (hAChR) alpha-subunit variant which is used as all or part of a protein for anodulating the autoimmune response of an individual to hAChR. The protein can be administered to alleviate and/or treat myasthenia gravis (MG), and is useful for diagnosing the condition. It can be combined with a suitable carrier in pharmaceutical compositions, and is useful for such therapeutic (especially nasal or oral) administration and diagnosis. MG is a human neuromuscular disorder, in which autoantibodies diagnosis. MG is a human neuromuscular junction. The extracellular from nerve to muscle at the neuromuscular junction. The extracellular domain of the AChR alpha-subunit appears to be the prime target for the protein enables antigen-specific immunotherapy which suppresses only extrace autoantibodies, particularly the main immunotherapy which suppresses only extrace autoimmune responses whilst leaving overall immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence is not given in the specification but has been by the indexer as specified in the claim usin the sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             intact, unlike current methods of treating MG using immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 MVDLPRPSCVTLGVPLFSHLQDEQWVDYNLKWNPDDYGGVKKIHIFSEKIWRPDLVLYND 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Receptors may be used in assay for materials which modify them. They may be produced in substantial, pure quantities for use in experimentation, development of insecticides without effect on hWNARs and treatment of parasitic infections. MADs raised to the peptides may be useful in detection of the structure of MNARs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human muscle nicotinic acetyl:choline receptor - used to assay
the effects of agents which affect acetyl:choline receptors in
skeletal muscles.

This sequence represents the alpha subunit of acetylcholine receptor protein. This sequence may be used in the construction of an whorepetide complex which comprises an antigenic peptide, eg. AChR where period is anyelin basic protein peptide MBP(1-14)A4, and an isolated MHC subunit component which has an antigen binding site, where the antigenic peptide is associated with the antigen binding site. The MHC-peptide complex selectively binds a T-cell receptor on T-cells associated with diseases, esp. autoimmune diseases. The coding sequence of this protien may be incorporated in to a sequence coding sequence of this protien may be incorporated in to a sequence coding sequence of this protien may be incorporated in the accomplant as the such that, when the subunit is expressed and folded, the AChR peptide antigen will be available as an epitope for the target the immune system which are responsible for undestrable immune responses. They may be used for treating autoimmune disease such as rheumatoid arthritis, multiple sclerosis or myesthnia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 VDYNLKWNPDDYGGVKKIHIPSEKIWRPDLVLYNNADGDFAIVKFTKVLLQYTGHITWTP 120

                                                                                                                                                                                                                                                                                                                                   The alpha subunit of the electric ray acetylcholine receptor (AChR) (AAR86421) is an autoantigen involved in the pathogenesis of myasthenia gravis. AChR peptide segments, e.g. amino acids 195-215, can be used in the construction of MHC class II-peptide conjugates. Such conjugates are able to inhibit deleterious T-cell mediated immune response, such as allergic reactions, allograft rejection, and autoimmune diseases, or to promote T-cell responses for use as

The AChR peptide 195-215, which has been characterised as an epitope in mysathenia gravis (MG) in humans and in mice, may be connected to the N-terminal antigen binding site of a polypeptide derived from an MHC antigen associated with MG. For example, if the recombinant complex is to be used in mice, the AChR peptide may be incorporated into a sequence encoding either the I-Ab-alpha or I-Ab-beta chain (see AAQ)5054-55 respectively). If the AChR peptide is to be incorporated into the beta chain, for example, the oligonucleotide may be inserted as a replacement for the leader sequence.

                                                                                                                                 The acetylcholine receptor alpha subunit given in sequence AAR45946 (corresponding mRNA in AA056918) and the myelin basic protein given in AAR45947 are antigenic peptides associated with autoantigens. They have been conjugated with MHC class II components such as I-Abalpha chain (encoded by sequence AA056919) or I-Ab-beta chain, encoded by AA056920) and a toxin or label to form conjugates used to target helper I-cells for the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VDYNLKWNPDDYGGVKKIHIPSEKIWRPDLVLYNNADGDFAIVKFTKVLLQYTGHI-TWT 119

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

G13872

nicotinic acetylcholine receptor alpha chain precursor - rat
C;Species: Rattus norvegicus (Norway rat)
C;Dete: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_change 20-Aug-1999
C;Accession: S13872
R;Mitzemann, V; Stein, E; Barg, B; Konno, T.; Koenen, M.; Kues, W.; Criado, M. Bur. J. Biochem. 194, 437-448, 1990
A;Title: Primary structure and functional expression of the alpha-, beta-, gamma A;Reference number: S13872; MUID:91099317; PMID:1702709
A;Reference number: MNA
A;Molecule type: mRNA
C;Superfamily: acetylcholine receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nicotinic acetylcholine receptor alpha chain precursor - mouse C;Species: Mus musculus (house mouse)

nicotinic acetylcholine receptor alpha chain precursor - African clawed frog C; Species: Xenopus laevis (African clawed frog)
C; Species: Xenopus laevis (African clawed frog)
C; Species: J960W-1988 #sequence_revision 19-Nov-1988 #text_change 20-Aug-1999
C; Accession: A28529
R; Baldwin, T.J.; Yoshihara, C.M.; Blackmer, K.; Kintner, C.R.; Burden, S.J.
J. Cell Biol. 106, 469-478, 1988
A; Title: Regulation of acetylcholine receptor transcript expression during developmen A; Reference number: A28529
A; Molecule type: mRNA
A; Residues: 1-457 < ABAL>
A; Molecule type: mRNA
A; Residues: 1-457 < ABAL>
A; Cross-references: GB:X07067; NID:g64510; PIDN:CAA30103.1; PID:g64511
C; Superfamily: acetylcholine receptor
C; Keywords: glycoprotein; ion channel; neurotransmitter receptor; postsynaptic membra F; 1-20/Domain: signal sequence #status predicted < SIG>
F; 21-457/Product: nicotinic acetylcholine receptor alpha chain #status predicted < AMAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nicotinic acetylcholine receptor alpha-la chain precursor - African clawed frog C; Species: Xenopus laevis (African clawed frog)
